BRAY/RITE® MODEL H-100

External Spring, Hydraulic Damper, and Weight

Use: Fluctuating flow application.

Design slows down the opening of the valve to protect the disc assembly in the last few degrees of travel.

BRAY/RITE® MODEL SA-3

Backflush Lever, and External Spring

Use: Application requires backflush process, or manual operation which may require additional force to close.

Lever allows manual operation and provides a visual indication of the disc position, and the spring provides force to assist valve closure where rapid media flow reversal conditions exist.

BRAY/RITE® MODEL SA-01

External Lever and Spring

Use: Valve needs additional force to close due to rapid media flow.

Design applies additional force for valve closure.

BRAY/RITE® MODEL SA-4

External Position Indicator

Use: Valve requires visual indication of disc position.

Provides a visual indication of the disc position (degree of open/close).

BRAY/RITE® MODEL SA-1

External Lever, Spring, and Weight

Use: Valve needs flexibility to decrease/increase closing time and application may require solids handling.

Design provides additional cracking pressure and weight to disc.

BRAY/RITE® MODEL SA-4A

Backflush Lever

Use: Application requires backflush process, or manual operation.

Lever allows manual operation and provides a visual indication of the disc position (degree of open/close).

BRAY/RITE® MODEL SA-2

Limit Switch

Use: Remote indication required within automated control system environment.

Design sends signal for remote indication of flow and valve position.

BRAY/RITE® MODEL SA-6

Foot Valve with Basket

Use: System requires straining of impurities to maintain pump prime.

Filter impurities in the line to maintain downstream pump prime, and allows valve to close as intended.

OPTIONAL SPECIAL ACCESSORIES FOR CHECK VALVES

BRAY/RITE® MODEL SA-7 Emergency Shut-off Fusible Link

Use: Valve requires failsafe protection in case of fire. Design allows fusible link to melt which releases lever to allow disc to close.

BRAY/RITE® MODEL SA-40A External Compression Spring, Lever, and Weight

Use: Valve needs additional force to close due to rapid media flow. Valve requires the ability to change the opening pressure of the valve, within a certain range and/or change the closing characteristics of the valve.

Design provides additional cracking pressure and weight to disc. Spring assists valve closure before flow reverses. This reduces or eliminates water-hammer and the associated problems where rapid media flow reversal conditions exist. The compression spring design protects the spring from the elements. The valve has been modified to increase the opening pressure. One weight is used to provide the necessary torque to close the disc, and the spring provides force to assist valve closure in rapid media flow reversal conditions. The weight also provides external mass to increase the cracking pressure and increase the closing force of the moving disc.

BRAY/RITE® MODEL SA-10 Dual-Balanced Weights

Use: Low flow rate applications (i.e. blower). Design provides weight #1 to adjust cracking pressure, and weight #2 to counterbalance the disc.

BRAY/RITE® MODEL SA-16 External Lever, and Weight

Use: Valve requires the ability to change the opening pressure of the valve, within a certain range and/or change the closing characteristics of the valve.

Provides weight to achieve necessary torque to close the valve. The weight also provides external mass to increase the cracking pressure and increase the closing force of the moving disc.

BRAY/RITE® MODEL SA-50 External Compression Spring, Hydraulic Damper, Lever, and Weight

Use: Fluctuating flow application. The hydraulic damper is used to reduce disc oscillations due to variations in flow, and to stop the disc from being slammed open

or closed. This model provides damping for the final few degrees of travel upon opening, and closing. Speed Controls + Compression Spring slow down the opening of the valve to protect the disc assembly. The compression spring design protects the spring from the elements. The valve is designed to close as soon as the flow starts to decrease with the help of an external spring and weight. This reduces or eliminates water-hammer and associated problems.

BRAY/RITE® MODEL SA-40 External Compression Spring, and Lever

Use: Valve needs additional force to close due to rapid media flow. Spring provides additional force to assist valve closure before flow reverses. This reduces or

eliminates water-hammer and the associated problems where rapid media flow reversal conditions exist. The compression spring design protects the spring from the elements.

SYMMETRICAL OR CANTED YOKES

The heart of the Series 98 actuator is the scotch yoke. This mechanism converts linear motion into rotational motion. The piston and/or springs directly couple to a rotating yoke with a slot that engages the sliding blocks.

This type of actuator has a distinct torque curve, which starts high, then dips toward the middle of the stroke, and ends with increasing torque — offering an inherent optimization of torque requirements associated with many valve applications.

SYMMETRICAL YOKE

- > Torque output curve is balanced.
- > Torque demands are similar at seat break and end positions.

CANTED YOKE

- > Torque output curve is shifted.
- > Torque demands are not the same at seat break and end positions.
- > Applications for optimizing the torque output vs shaft angle curve.

SCOTCH YOKE COMMON FEATURES

- > Compact design offers a high torque-to-weight ratio.
- > Modular design offers multiple configurations, providing flexibility and efficiency at reduced cost.
- > Module alignment ensured by precision machined centering rings.
- > Symmetrical yoke or canted yoke options available to meet a broad range of application torque requirements.
